Team	Feedback	Response
Professor	Handle password strength on frontend	Currently, password strength verification is integrated into our DB model via use of an npm package so it would be difficult to transition the job to be done on frontend at this point in the project when finishing other features is a priority
Librarians	Email verification for forget password/username	This would be great to have, but this would require use of a third party microservice which would cost real money
Librarians	Short answer quiz is too strict with grading	Another good thing to have. Currently, grading is done by seeing if the user provided answer is equal to the answer on the flashcard. Changing it so that the user provided answer doesn't have to be the exact same would require comparing the meaning of each answer via machine learning which is beyond the scope of the project (currently on final week)
